WP Manual RSoC Post Creation
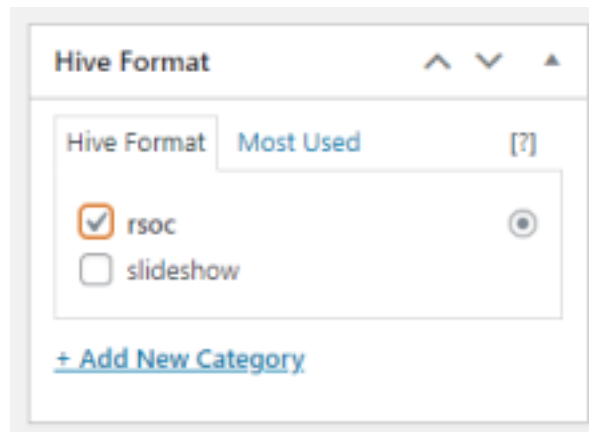

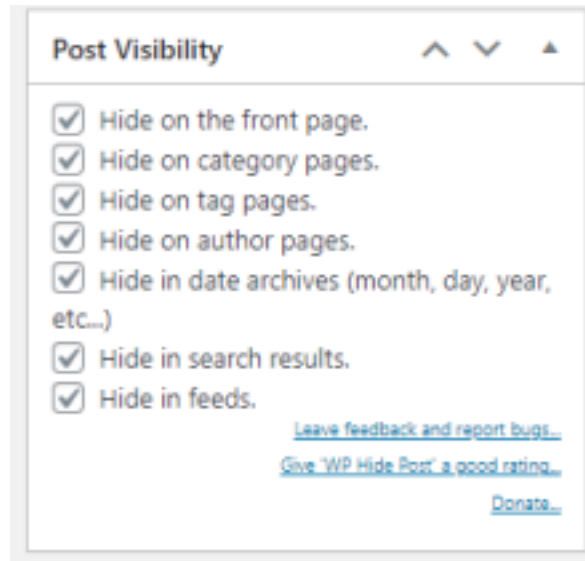

Tags	Engineering Documentation

This document covers how to create a RSoC post in WP via the Admin panel

Required settings

When creating a new article in WP, the main requirement for it to be treated as an RSoC post is to set the Hive Format taxonomy to rsoc in the sidebar of the admin panel:

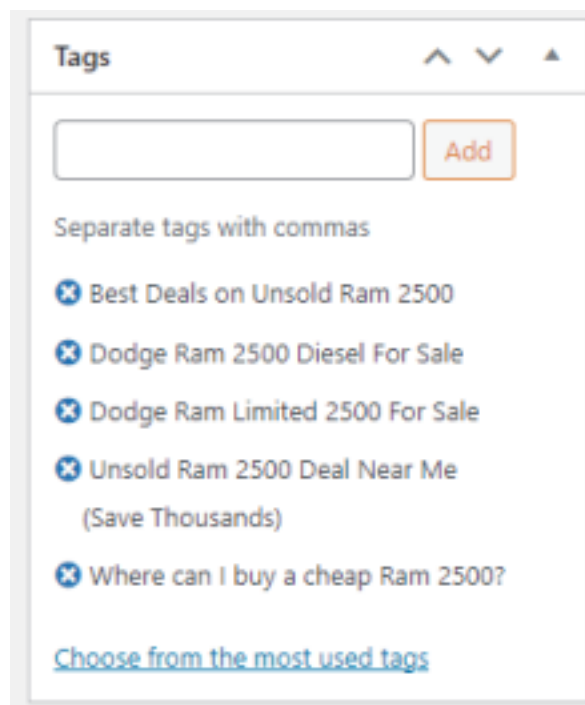

If the article should not be accessible via the homepage or search results, we want it to be hidden from all sources. This is managed in the Post Visibility section:
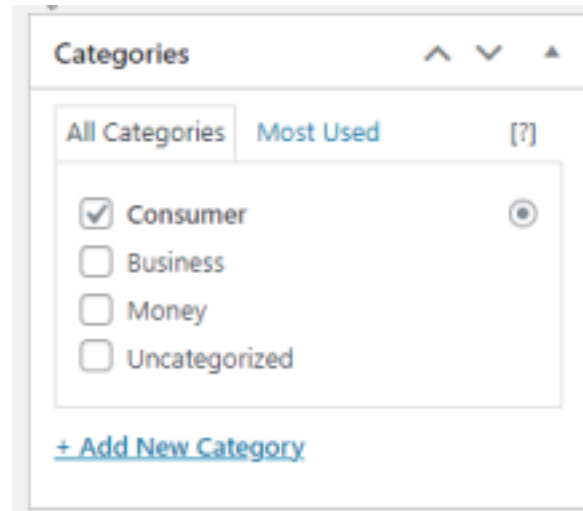

Optional Settings

The writer can control what terms are shown in the Related Search widget on the RSoC post. This is managed via the Tags section. NOTE: **If this section has under 3 terms, they will be ignored** since the Adsense widget requires at least three suggested terms to fill out the six Related Searches.

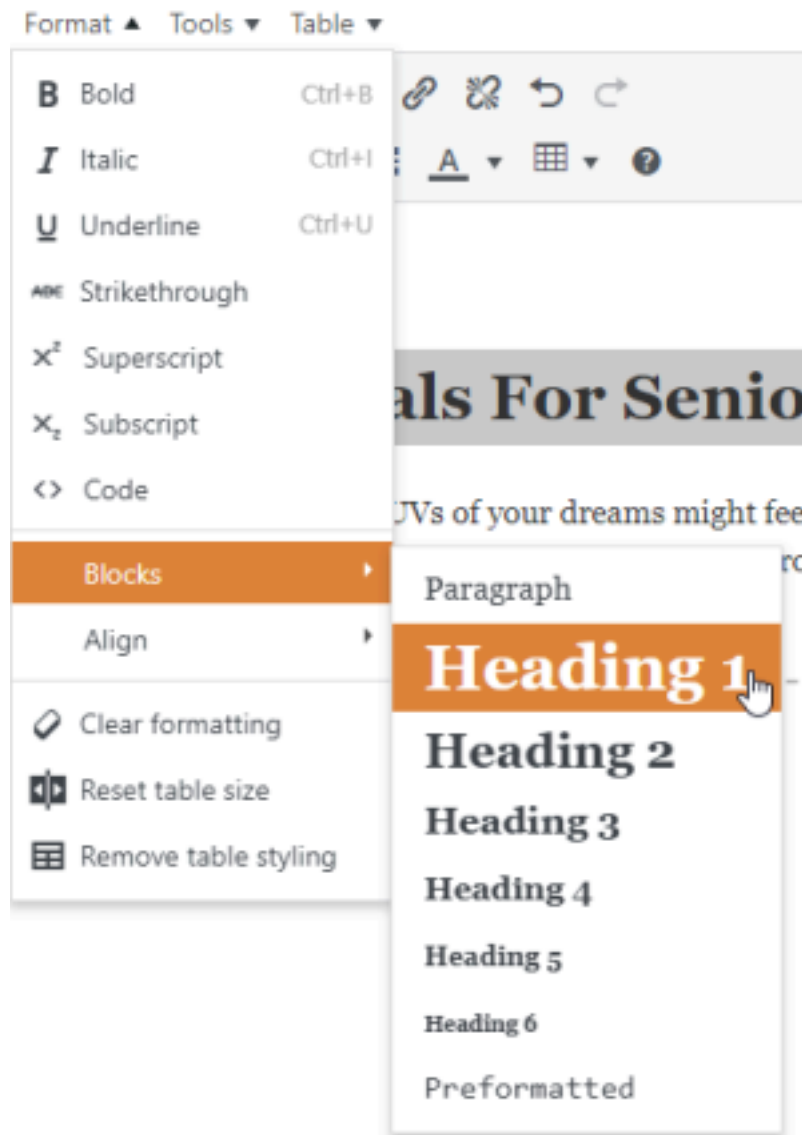

WP Manual RSoC Post Creation 2

In order for the url to not show the uncategorized slug, the article needs to have a Category set:
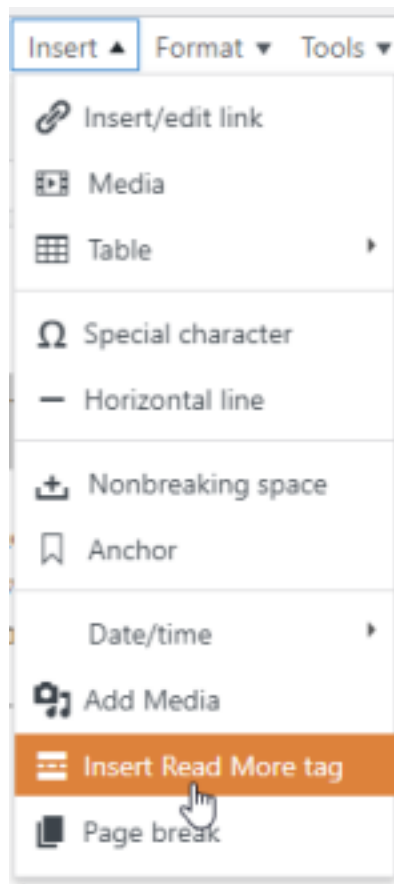

Article Layout

Majority of the content of RSoC posts are hidden behind a Read More link. If the writer does not specify where the Read More link should be, the system will attempt to guess where to add this which may not be ideal. The ideal RSoC layout will be as follows:

<h1> Heading 1 for the article </h1>

Format ▲   Tools ▼   Table ▼

B Bold   Ctrl+B
I   Italic   Ctrl+I
U   Underline   Ctrl+U
ᴬᴮᶜ Strikethrough
x² Superscript
x₂ Subscript
<> Code

Blocks   ▶

Align   ▶

⬭ Clear formatting
◫ Reset table size
⊞ Remove table styling
